

What features you implemented successfully

We successfully implemented the required features such as:

- Registration page to register a new user of any type (instructor or student).
- Login page for registered users with their login information.
- Grade and Remark pages tailored for each Instructor and Student.
- Grade page for Instructor:
Instructor will have two pages for viewing and inserting grades. Instructor will be able to see all students' grades based on the assignment name. Each grade will have a button for the instructor to regrade that specific score. On the inserting grades page, instructors can insert grades one by one based on student name and assignment. This inserting function has ensured that there will be no duplication for the same assignment and student.
- Grade page for Student:
Students are able to see their own grade on each assignment. On each assignment, students will be able to submit a remark request regarding that assignment. After clicking the button, there will be a textarea which the student can fill to enter their reasoning regarding requesting the remark.
- Remark page for Instructor
After a student submitting a request on remark, the instructor will be able to see the request with 'Pending' status. On the right, instructors are able to approve or reject a request with a click of a button.
- Remark page for Student
Students can see the status of their request such as 'Pending', 'Approved', 'Rejected'. After just submitting a request, the status will be 'Pending'. After the instructor changes the status, the student can also see the change.
- Anonymous feedback submission. Students will be able to send anonymous feedback to a directed instructor in different questions. Instructor will only be able to see the feedback that are directed to them
- Logout option for user to ease change between account (if needed)

What features you struggled with (if any)

Although we have used CSS from the second assignment, we still struggle with the use of it for extensive buttons and div. However, due to this assignment we have familiarized ourselves with the basic CSS fundamentals. Aside from that, we struggled a bit in learning the new syntax/language which is JavaScript since it was just recently being taught.

Any extra features added

While registering a new user account, we added password confirmation by making users type their password twice. Hence, reduce the possibility of an incorrect password being saved.

How the work was divided among team members

Lucia Giovani worked on the Login and Registration page. She also helped the development of the 'Student' page such as the database for the 'Remark' page. Aside from that, she also incorporated the "Hello [name]" in the home page. She helped on the other required .txt submission.

Nathanael Sitepu worked on all of the 'Teacher' pages. Starting from the database, all the CSS, and all other required pages.

Shafira Devi worked on the 'Student' pages with Luci help. From viewing student marks, request remarks, and submitting anonymous feedback.
